  STRANDED TELOMERIC OVERHANG. MAY ALSO PARTICIPATE IN TELOMERE LENGTH REGULATION DURING DNA REPLICATION. BIND SPECIFICALLY TO THE TAGA-CONTAINING EXTENSION ON THE 3'STRAND AND PROTECT THIS REGION OF THE TELOMERE FROM NUCLEASE DIGESTION AND CHEMICAL MODIFICATION. SUBGUNIT: HETERODIMER OF AN ALPHA AND A BETA SUBUNIT. SUBCELLULAR LOCATION: NUCLEAR.
MISCELLULAR LOCATION: NUCLEAR.
MISCELLANEOUS: THE SEQUENCE OF THE A (OR ALANINE) VERSION IS SHOWN. THE S (OR SERINE) VERSION DIFFERS IN ONLY TWO POSITIONS, AND THE K VERSION IN ONLY ONE. THERE MAY BE OTHER VERSIONS IN
                                                                                                                                                                           1 95:963-974(1998).

$56233

probable membrane protein YFL021w - yeast (Saccharomyces cerevisiae)

C:Species: Saccharomyces cerevisiae

C:Date: 02-Sep-1995 #sequence_revision 19-Oct-1995 #text_change 06-Feb-1998

C:Accession: $56233

R;Murakami, Y; Naitou, M.; Hagiwara, H.; Shibata, T.; Ozawa, M.; Sasanuma, S.I.; Sasanumitted to the EMBL Data Library, May 1995

A;Description: Analysis of the nucleotide sequence of chromosome VI from Saccaromyces cells. Pacession: $5623

A;Accession: $5623

A;Accession: $5623

A;Accession: $5623

A;Accession: $5623

A;Cross-references: EMBL:D50617; NID:g836685; PID:d1009858; PID:g836733; MIPS:YFL021w

C;Genetics:

A;Gene: SGD:GAT1

A;Cross-references: SGD:S0001873; MIPS:YFL021w

A;Map position: 6L

C;Superfamily: GATA-type zinc finger homology

C;Reywords: transmembrane protein; zinc finger

F;14-30/Domain: transmembrane #status predicted <TM1>
F;307-360/Domain: GATA-type zinc finger homology <GZF>
exonuclease 46 (EC 3.1.11.-) chain 2 - C;Species: phage T4
A;Note: host Escherichia coli
C;Date: 17-Mar-1987 #sequence_revision
C;Accession: A04298; T10162

NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry: an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:

The sequence of this clone was established as part of a mapping and sequencing collaboration between the NHGRI Chromosome 7 Mapping Project (Eric D. Green, Director), John D. McPherson in the Department of Genetics (Washington University), and the Washington University Genome Sequencing Center. For additional information University Denome Sequencing Center of additional information about the map position of this sequence, see http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:

This clone was derived from human PAC library RPCI-5, prepared Pieter de Jong and coworkers at the Roswell Park Cancer Institut (http://bacpac.med.buffalo.edu) using the method described by Ioannou et al., Nature Genetics 6:84-9 (1994). The library is one male donor Institute is from

The clone may be obtained either from Genome Systems, (http://www.genomesystems.com) or Research Genetics, (http://www.resgen.com); or from Pieter de Jong. Inc.

NEIGHBORING SEQUENCE INFORMATION:
Actual start of this clone is at base position 1 of RP5-907C10;
actual end is at 154959 of RP5-907C10.

The RP5-907C10 sequence from 4689 to 5920 ıs from PCR product

                                                                                                                                                                                                               The present invention relates to a composition comprising two nuclei acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                      Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses or a single surface -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide D1954

                                        The present invention relates to single exon nucleic acid probes (SE) The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are use for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                    Claim

                                                                                                                                                           The present invention relates to a composition comprising two nuclei acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full length cDNAs. The primers are also useful for the cCC detection and/or diagnosis of the abnormality of the proteins encoded by CC cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH3633 to AAH1842 represent human cDNA sequences; AAB92446 to CC AAB35893 represent human amino acid sequences; and AAH13629 to AAH13632 CC represent oligonucleotides, all of which are used in the exemplification could be comprised to the comprise of the complement of the complemen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

```
CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises at least 15 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by CC the full-length cDNAs. The primers allow obtaining of the full-length CC CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAB13633 to AAH18742 represent human cDNA sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification CC of the present invention.

Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -

Claim 8; SEQ ID 11187; 2537pp + CD ROM; English.

The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC objected and oligonucleotide comprising a sequence complementary to a sequence and an oligonucleotide comprises a 3'-end sequence complementary to a cC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide which comprises a 1'-end sequence, where the CC oligonucleotide comprises a 1'-end sequence, where the 5'-end sequence/3'-end sequence is selected from those defined in CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primers sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for clustering encoded by CC chapses and chapses the companion cald sequences; and AAH13628 and CC AAB13633 to AAH18742 represent human cDNA sequences; and AAH13629 to AAH13632 cof the present oligonucleotides, all of which are used in the exemplification.

                                                                      assays
C.N.S (
                                                                                                             The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral_gclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activitites such as: Immune system suppression, Activinjoinhibin activity, chemotractic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tang
